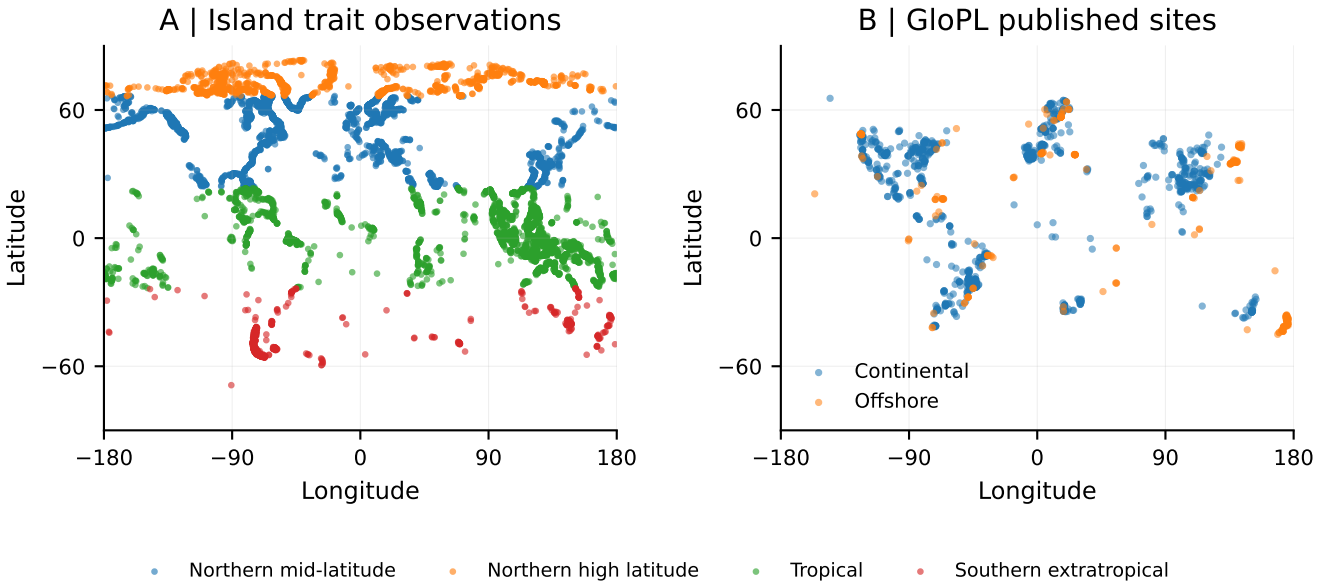

Figure 1 | Geographic sampling and inference boundary

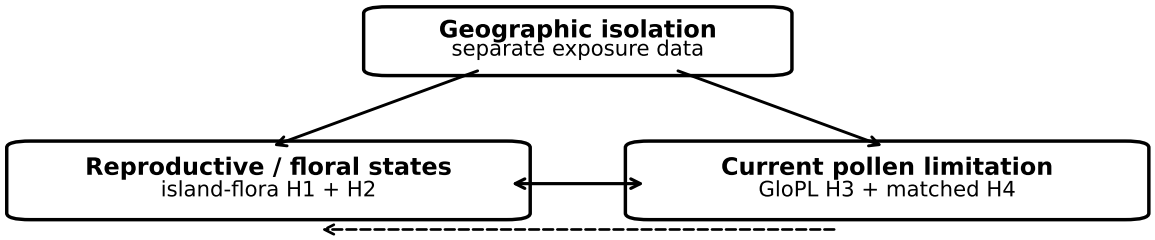

C | Island assemblage data

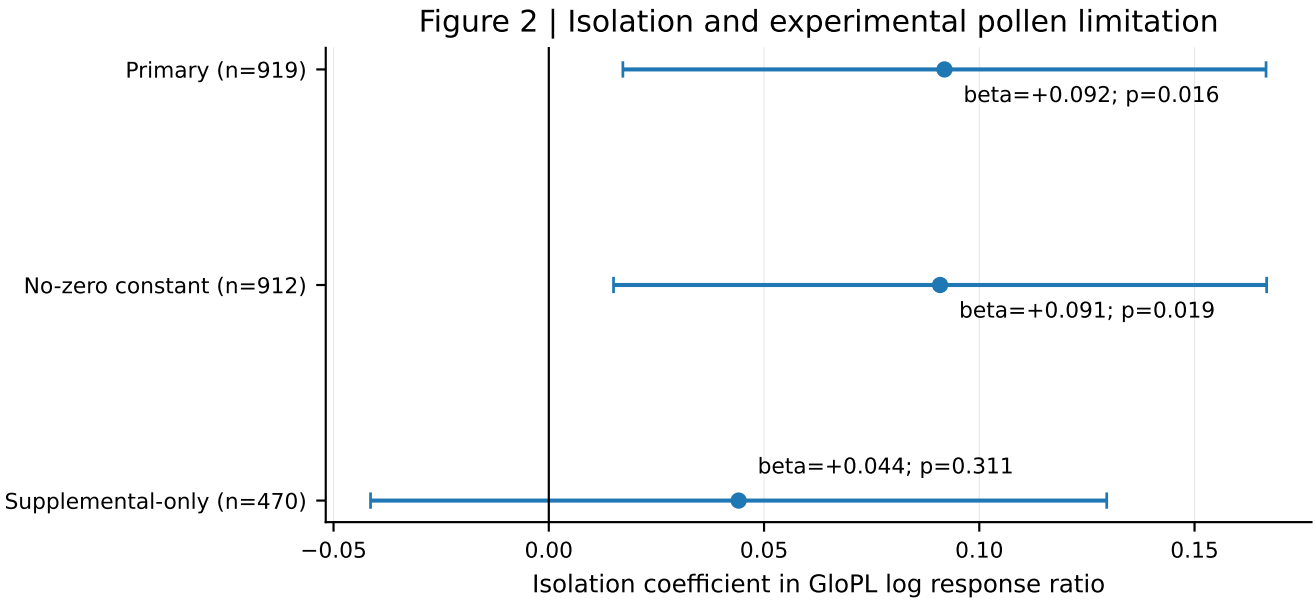

8,264 corrected island units
4,379 broad-H1 sampled islands
106,295 accepted species (universe)
222,688/318,885 resolved trait cells
69.83% raw-axis completeness

D | GloPL experiments

2,969 experimental rows
1,248 sites / 919 publications
996 true continental zero sites
Exact H4 matches: 455 / 143 species
(two distinct analysis sets)

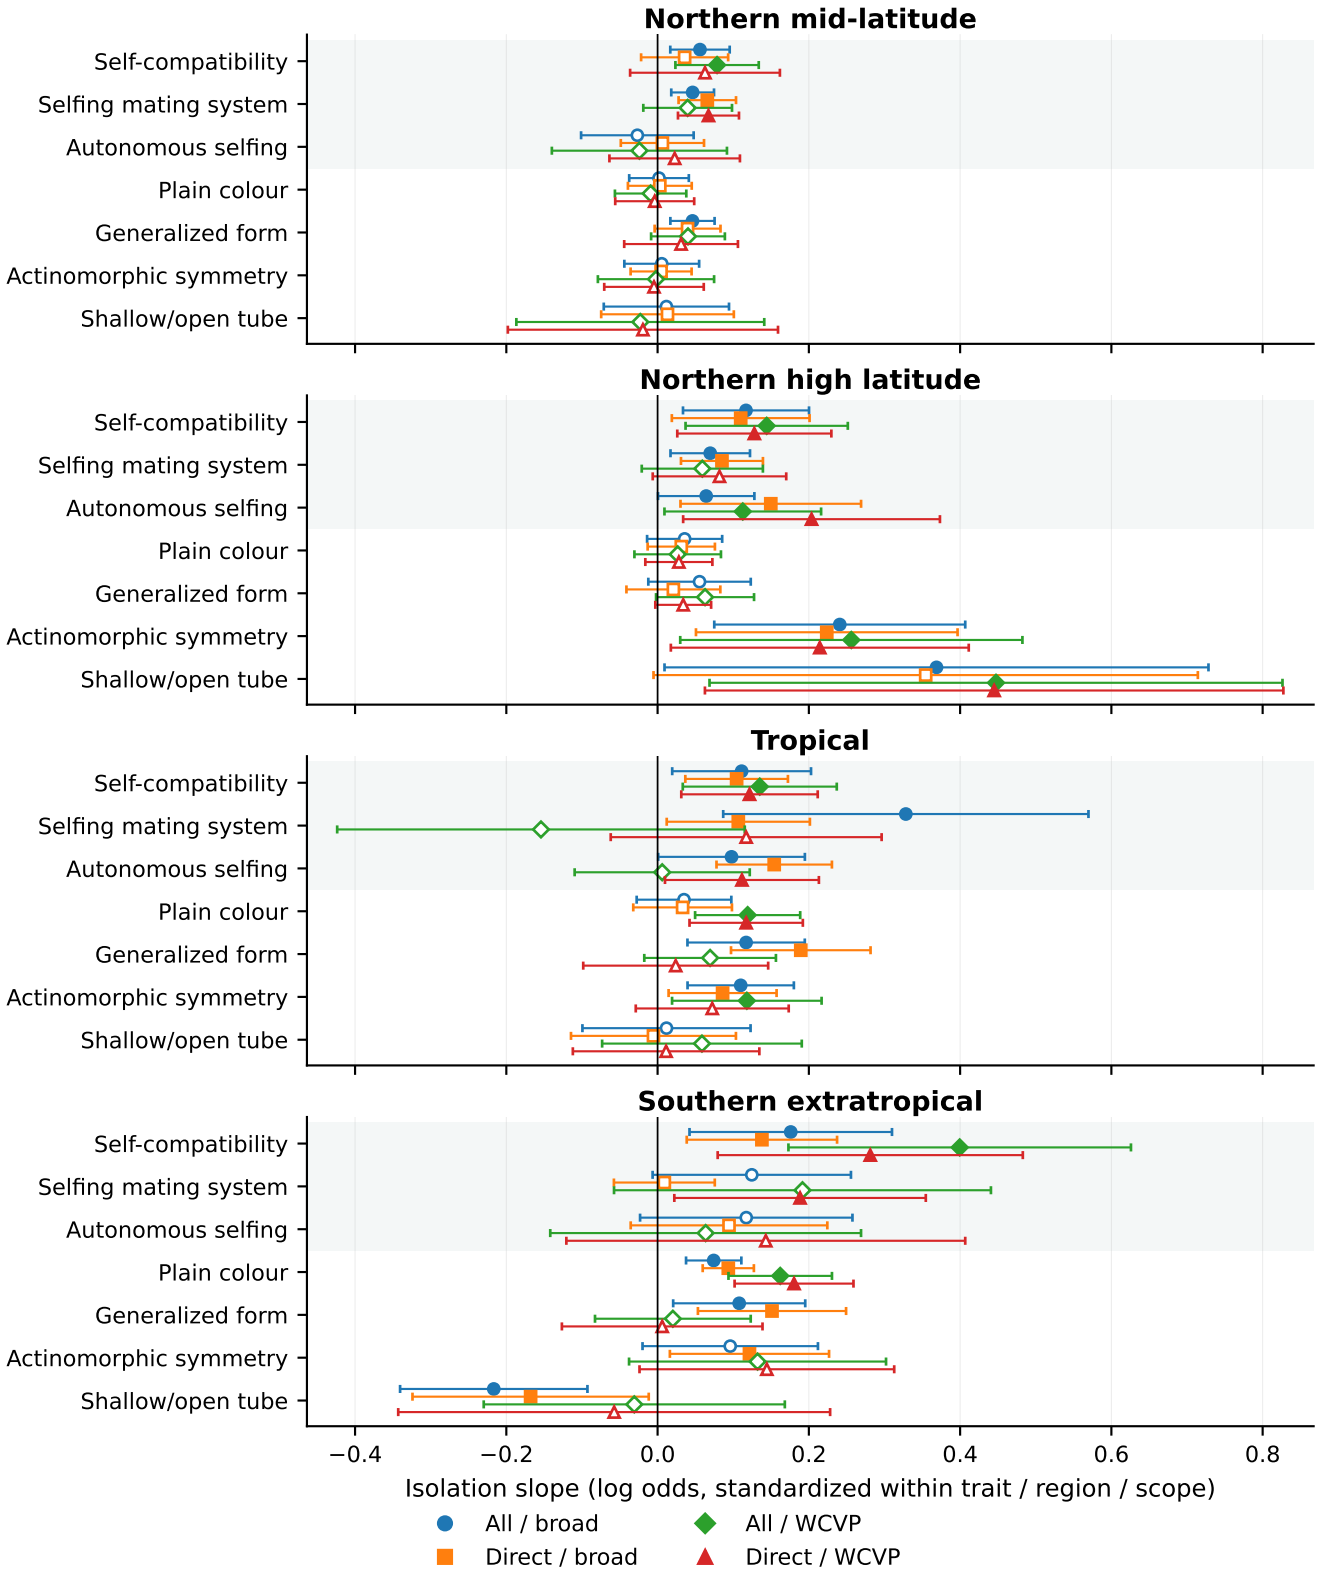

Solid arrows: fitted associations across separate samples.

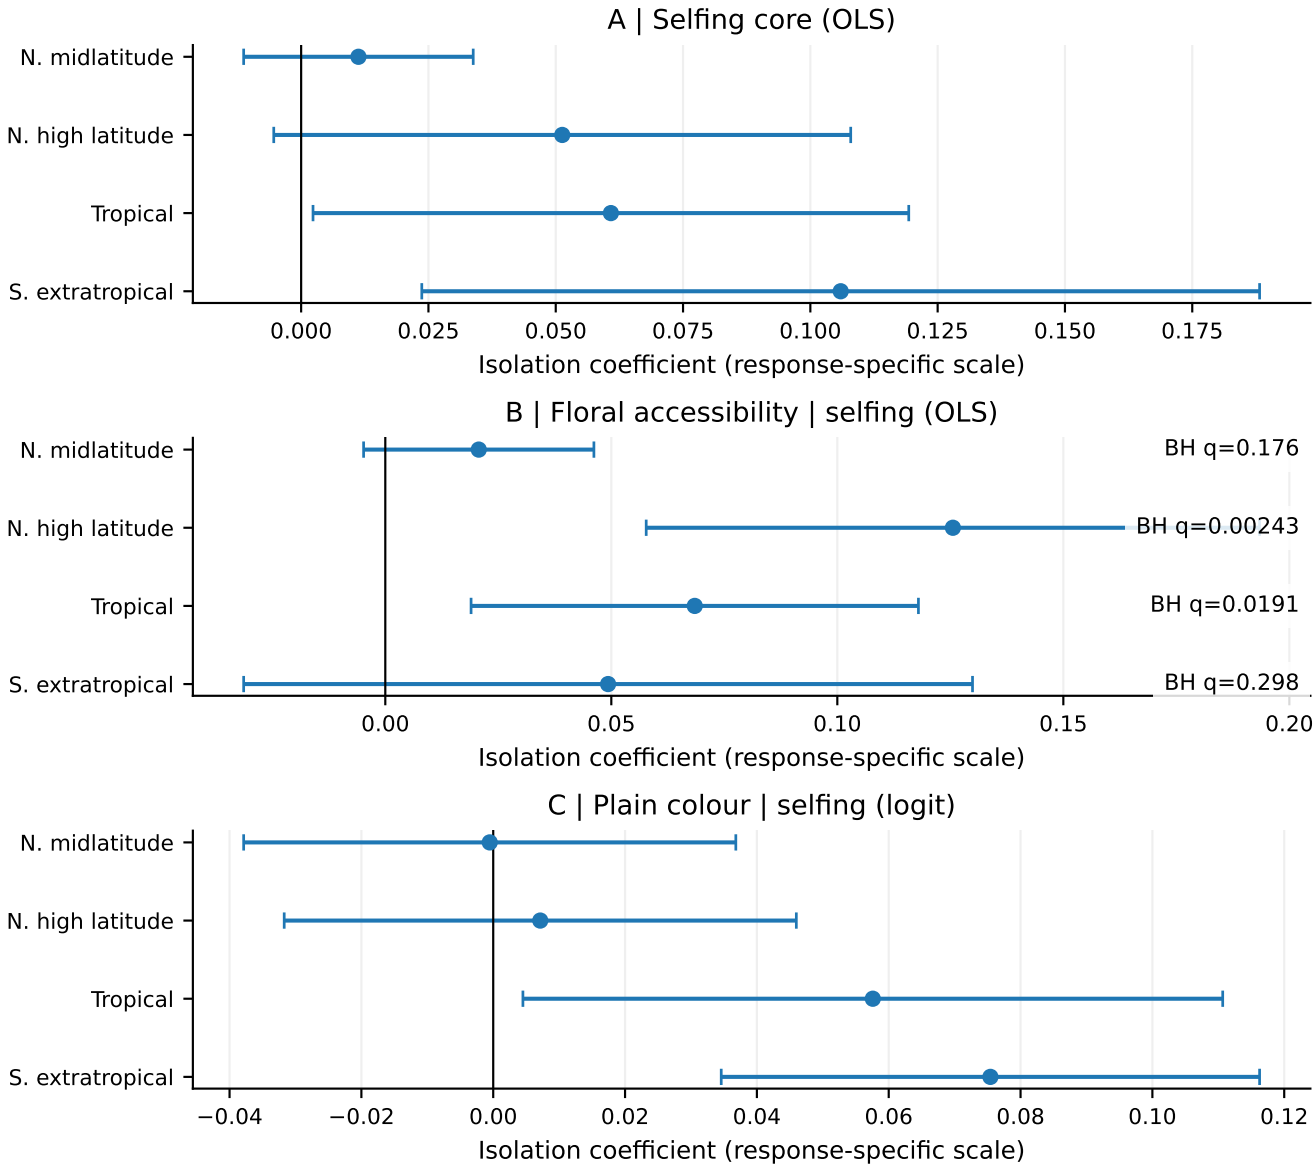

Publication-t 95% CIs. Supplemental-only result is unsupported.

Figure 3 | Seven traits in four geographic regions

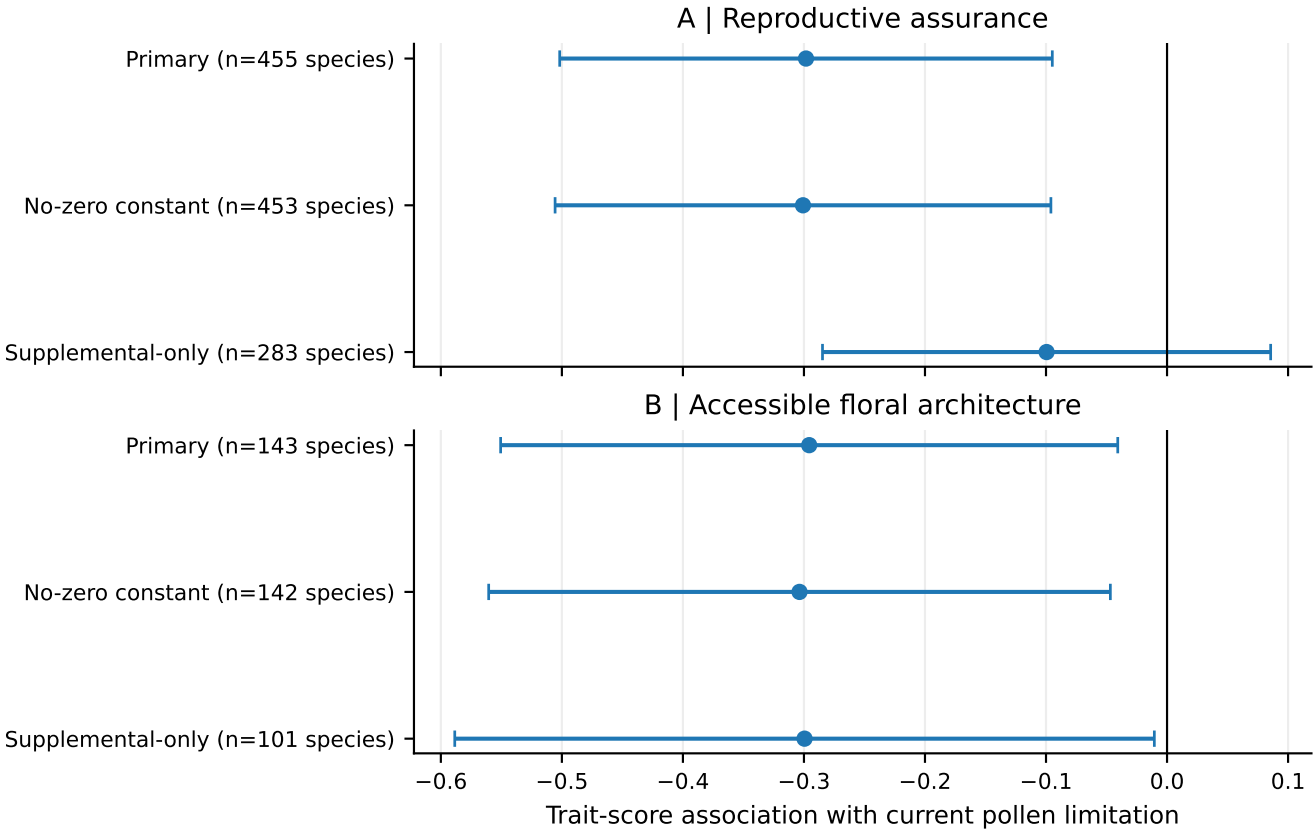

Pointwise 95% cluster-t CIs. Filled = nominal two-sided p < 0.05 (unadjusted).

Figure 4 | Assurance and independent floral associations

Response scales differ; H2 is conditional association, not historical mediation.

Figure 5 | Exact-species functional consistency (post-hoc)

Different matching sets (455 vs 143 primary species); publication-t 95% CIs.
